

# Annual Traffic Volume Report

## Central Region

1999 • 2000 • 2001

Alaska Department of Transportation  
& Public Facilities

# Unalaska

The city of Unalaska, on an island bearing the same name, is located mid-way along the Aleutian chain. It is 800 miles southwest of Anchorage and 1,140 miles from Seattle. Amaknak Island, commonly referred to as “Dutch Harbor,” sits along side Unalaska Island and is connected by a bridge. Over 4000 people reside in the community year round. This number can more than triple during the fishing season.

The islands were originally inhabited by the Unangan people. They lived, hunted and traded on these islands for thousands of years before being visited by a small group of Russian fur traders lead by Stepan Glotov in 1759. It was the Russians that gave the Unangan the name “Aleut.” In 1825 they built the Holy Ascension Orthodox Church, which is now the oldest Russian Orthodox cruciform-style church in North America.

In June, 1942, Unalaska was bombed by Japanese zeros, making it the only location in North America, other than Pearl Harbor, to be bombed during World War II. During this time, the Unangan were relocated to abandoned fish canneries in Southeast Alaska. There they faced harsh conditions for three years before they were able to return to Unalaska. Remnants of the war can be seen all over the island. Nestled along the hills is Quonset huts, barracks, bunkers and turrets.

In recent years, Unalaska has grown to be the transportation hub for the region, and the number one fishing port in the United States. Nearly 90% of the work force is involved in the fishing industry.

This year, a traffic map of Unalaska was added to the collection of traffic maps available free of charge from Highway Data. Contact information is located at the back of this report.

## Part I

# Introduction

# Introduction

The Highway Data Section provides data describing the volumes (number of vehicles) and other characteristics of traffic over the state highway system for use by engineers, planners, administrators, and others whose work requires such information. The traffic data program includes the collection of count data, data editing, data processing, analysis, report preparation, data distribution, computer traffic modeling, traffic forecasting, equipment installation and maintenance, data file maintenance, and the annual planning of activities.

The Central Region contains the largest concentration of population in the State of Alaska, and is the most far-flung of the three Regions. The contiguous highway system runs from the Homer Spit at the end of the Sterling Highway to the Regional boundaries on the Glenn Highway at MP 118 near Eureka, and the Parks Highway at MP 163 at Little Coal Creek. It includes Kodiak Island and the Aleutian Chain, as well as the isolated villages south of the Kuskokwim River, and all points in between.

The following report is a summary of the data collected in the Central Region from 1999 through 2001. The key elements are:

Permanent Counts: Traffic volumes, by direction of travel, collected year-round with Permanent Traffic Recorders (PTRs) at a number of permanently established locations. These counts are summarized yearly and used to provide seasonal adjustment factors applicable to coverage counts recorded at all other locations.

Coverage Counts: Traffic volumes, sometimes by direction of travel, are typically collected for seven days, with a minimum of one weekend and one weekday. These counts are on a cycle of one to three years at selected locations on the state, borough, and municipal road system. Most coverage counts are taken between May and September because the weather related road conditions make counting very difficult the remainder of the year. Because summer traffic is generally much higher than other times of the year, the counts are adjusted for weekday and seasonal variations using one or more associated permanent traffic recorders (PTR's) to obtain an estimated Annual Average Daily Traffic (AADT). The calculated AADT then represents the traffic on the specific traffic link on which the count was taken.

Vehicle Classification Counts: Traffic volume counts that classify all vehicles by type, based on the axle arrangement, number of trailers, and other vehicle characteristics. Class counts are collected for periods of time ranging from 16 hours to seven days or more. At key permanent locations data is collected throughout the year using permanently installed detectors and counters.

Weigh-In-Motion (WIM): Traffic counts which classify all vehicles by the same criteria as the vehicle classification counts, but include the added dimension of axle weights for all commercial size vehicles. The Highway Data Section conducted tests on several WIM systems in 1990 and 1991. The installation of several of these systems provides data specifically for road design, monitoring design and material performance, and testing of experimental materials and pavement design. WIM data is not included in this report.

This year the Department of Transportation and Public Facilities continued to implement changes of route naming and numbering of roads in the CDS Roadlog database. The purpose was to make the database more user friendly by assigning route numbers that reflect current road names as assigned by local communities. Previous to these changes, some numbered routes included up to 7 different roads or parts of different roads. The analysis and inventory of all the routes is not complete, but this document contains the latest changes implemented. Part II contains a cross-reference of road names and CDS road numbers. This report sorts and lists information by Route Number.

## **Definitions:**

Annual Average Daily Traffic (AADT): The estimated number of vehicles traveling over a given road segment during one 24 hour day. In practice, AADT is usually obtained from a sample (coverage count) adjusted for seasonality.

Automatic Polling: A method of obtaining data from automatic counters by telephone from a central computer location with automatic dialing equipment. Automatic counters in the field must have microprocessor memory and telephone connection.

Automatic Vehicle Classifier (AVC): Traffic counting equipment which automatically counts and classifies vehicles passing over its detectors, providing a record of those volumes by specific time intervals and vehicle classes.

Axle-Body Combination: A vehicle description based on the configuration of axles, leading and trailing units, and tractor body.

Axle Correction Factor: The proportion by which a volume count based on axles (e.g., from pneumatic tube detectors) is multiplied to obtain an estimate of the number of actual vehicles. The ratio is 1.0 or less, and is derived from vehicle class counts.

Collector: A road classification applicable to roads serving a mixture of local access and through traffic, for which the volume, average speed, and trip length of vehicles using the road are usually lower than for principal or minor arterials, but higher than for local roads.

Coverage Count: Hourly (sometimes directional) total traffic volumes collected for a three-to-seven day period on a cycle of one to three years. Counts are generally done with a portable automatic traffic counter using pneumatic-tubes (hoses) or inductive loops in the road. Locations of counts remain the same from one rotation year to the next.

Highway Performance Monitoring System (HPMS): The data reporting system developed by the Federal Highway Administration (FHWA) for standardized road inventory, physical condition, and traffic use monitoring by all states.

Interstate Highway: A highway within the principal arterial category that is also designated as part of the Federal Interstate Highway System.

Link: A section of a road for which traffic data is reported. Link termini are located so that the traffic volume is roughly constant on a link.

Link Volume: The number of vehicles passing over a highway link in a given time interval. Time intervals may range from 5 minutes to 24 hours, as observed or as averaged over longer periods.

Local Road: Any street or highway (regardless of ownership) which is not classified as any higher type of arterial or collector road. Local roads serve mostly local-access movements, at lower speeds and volumes than roads of other classifications.

Minor Arterial: A street or highway serving mostly through movements, but with shorter trip lengths and at lower speeds than principal arterials.

Monthly Average Daily Traffic (MADT): The estimated average daily traffic volume for a specific month at a given location.

Permanent Count: Hourly, directional or non-directional total traffic volumes collected year-round with Permanent Traffic Recorders (PTRs) at established locations. These counts are used to adjust coverage counts for seasonal variations to yield AADTs.

Permanent Detector: A vehicle detector that is permanently installed in a roadway, as compared to a portable detector. The most common permanent detector equipment employs an inductive loop that senses a vehicle's presence as a change in the electrical characteristics of the loop. Piezo electric cables are used in conjunction with inductive loops to detect and sometimes weigh vehicle axles to determine a vehicle's type (classification) and sometimes weight.

Permanent Traffic Recorder (PTR): Traffic volume counting equipment that automatically counts vehicles passing over detectors, providing a record of those volumes by specific time intervals.

Pneumatic-Tube (Hose) Detector/Counter: A vehicle-detection device/counter consisting of a pneumatic rubber tube placed across a roadway, and which detects vehicles by sensing air pressure pulses from the vehicle axles passing over the tube.

Portable Counter: An automatic traffic counting machine which is moved from location to location where needed, rather than permanently installed in one location.

Principal Arterial: A street or highway connecting major population centers with high traffic volumes, long average trip lengths, and very little local travel service.

Sampling Plan: A plan for collecting a sample from a larger population (e.g. traffic counting at a few locations to estimate traffic at all locations).

Seasonally Adjusted Count: A traffic volume count that has been adjusted to an annual estimate from a raw count. The adjustment is based on the estimated relationship between volumes for the period counted and the annual average at one or more PTRs.

Vehicle Classification Count: A volume count which classifies vehicles by type (trucks, trailers, buses, recreational vehicle, automobiles, motorcycles, etc.) based on axle arrangement. Data may be collected manually or using specially designed automatic counters.

Vehicle Miles of Travel (VMT): For any given highway link or combination of links, the sum of miles traveled by all vehicles; usually calculated as the sum of the products of each link length and annual average daily traffic (AADT) for that link.

$$\text{VMT} = (\text{Link Length}) \times (\text{Link AADT})$$

Part II

## Route Listing

## **Road Listing by Route Name and by Route Number**

The road listing is a cross-reference guide to match common road names to the Coordinated Data System (CDS) route number. The CDS route number is a data base reference number and not to be confused with federal aid route numbers or road signing numbers. The CDS route may be assigned to a single road or it may contain several roads or parts of roads. Conversely, a single road may be divided into multiple CDS routes. Each year route numbers may be added, changed or divided into separate routes. The mileage listed for the route or road named in the index may represent only a portion of that road's total length. Also, road lengths represent only that portion of the road on which traffic data is collected. More detailed data and route descriptions can be found in Part III.

## Part III

# Annual Average Daily Traffic (AADTs)

# Annual Average Daily Traffic

Part III contains Annual Average Daily Traffic (AADT) tables for many roads in the Central Region. Traditionally these were state owned or maintained roads, but starting in 1991, most roads above the functional class of local (9 and 19) have been added to the traffic counting inventory regardless of their ownership. The average daily traffic varies on any length of highway because of numerous breaks in the traffic pattern. Businesses, shopping centers, recreation areas, crossroads, etc. change the flow and direction of traffic. To determine vehicle miles of travel, highways are divided into sections by significant traffic breaks. These sections are called links. The AADT of a link multiplied by the length of the link results in the number of Vehicle Miles of Travel (VMT) for that section. VMT is used for economic comparisons, computing accident rates, analyzing road use and motor vehicle use growth rates.

Raw data from coverage counts, adjusted for seasonal variation, is the basis for determining traffic link AADTs. Links not having raw data are estimated by using growth rates determined by analysis of Permanent Traffic Recorder (PTR) data, or comparisons to other counted links. This is done to assure that all vehicle mileage was updated and included, and therefore provides compatible data to compare to historical data for analysis.

## Functional Class (FC):

### Code      Description

#### Rural

- 1      Principal Arterial -- Interstate
- 2      Principal Arterial -- Other
- 6      Minor Arterial
- 7      Major Collector
- 8      Minor Collector
- 9      Local Road

#### Urban

- 11     Principal Arterial -- Interstate
- 12     Principal Arterial -- Other Freeways and Expressways
- 14     Other Principal Arterial
- 16     Minor Arterial
- 17     Collector
- 19     Local Road

Note: Many of the routes identified by a specific number contain portions of several different roads. To identify the route number associated with a road name please refer to the road index in Part II.

Vehicle Miles Traveled (VMT) is also included in this section.

## Part IV

# Permanent Traffic Recorders (PTRs)

# **Permanent Traffic Recorder Summaries**

Part IV contains summaries of each of the major permanent traffic recorders (PTR's). These recorders have been strategically placed throughout the region to provide accurate, year round, hourly traffic volume data for the purpose of expanding coverage counts to AADT's and show historical traffic trends.

The PTR index references the locations by the CDS route number and milepoint, which often does not correspond to milepost locations on the road. The summaries show seasonal, day of the week, and hour of the day traffic statistics. Each day of the week and the time periods of 6 AM to 10 PM and 10 PM to 6 AM are listed as an average percent of the Monthly Average Daily Traffic (MADT). Also included are the highest days and highest hours of traffic with the associated percentage of the AADT. Most critical (in urban traffic) is the 30th highest hour called the design hourly volume (DHV). The DHV is used for determining the design and structure of new roads or to improve existing roads in urban areas. The Historical Data section of each summary lists all the AADTs on record for each station's specific location. Where the data is available, each station's MADTs for the years 1991 through 2001 are graphed to show seasonal and yearly traffic trends.

Changing traffic patterns are in response to changes in population totals, workplace, and construction during summer peak months, which may have caused changes in routes taken. Increases in both peak and winter traffic indicate changes in resident usage, while increases in peak summer traffic only more likely indicate increased tourism or summer workers.

## Part V

# Classification Data

# Vehicle Classification Data

Part V contains a summary of vehicle classification data that has been either manually tabulated or automatically recorded by vehicle classification counters. Data collection locations are determined by either HPMS statistical sampling requirements or highway construction projects. Data is collected over a 16-hour period by manual methods, 24 hours up to one week if portable automatic vehicle classifiers (AVCs) are used, and continuous data at some locations where permanent AVCs are installed.

The data is summarized to provide percentages of vehicles falling into categories determined by vehicle type and axle arrangement. The FHWA Vehicle Classification standard was used to categorize the vehicles into 13 classifications. The percentages of Class 2's and Class 3's may not be individually accurate due to limitations on the ability of AVC equipment to distinguish between all cars and pickup trucks based solely on axle spacing. The combined percentages of Class 1's, 2's and 3's do accurately represent the total of non commercial vehicles. Classes 4 through 13 are considered commercial type vehicles. The volume of heavy commercial vehicles in the traffic stream is of major importance for road structural and geometric design.

## FHWA 13 Classifications:

### Single Unit

- Class 01: Motorcycles
- Class 02: Automobiles, Automobiles with Trailers
- Class 03: Pickup Trucks, Pickup Trucks with Trailers
- Class 04: Buses (2 or 3 axles)
- Class 05: Delivery Trucks, Recreational Vehicles, Dump Trucks (2 axles, 6 tires)
- Class 06: Dump Trucks, Recreational Vehicles (3 axles)
- Class 07: Concrete Trucks, Fuel or Propane Delivery Trucks (4 or more axles)

### Single Trailer

- Class 08: Tractor/Truck with Trailer (3 or 4 axles)
- Class 09: Tractor/Truck with Trailer (5 axles)
- Class 10: Tractor/Truck with Trailer (6 or more axles)

### Multi-Trailer

- Class 11: Tractor/Truck with 2 Trailers (5 axles)
- Class 12: Tractor/Truck with 2 or more Trailers (6 axles)
- Class 13: Tractor/Truck with 2 or more Trailers (7 or more axles)

## Traffic Direction Codes:

North bound = 1	South bound = 5	North/South bound = 9
East bound = 3	West bound = 7	East/West bound = 0

## Part VI

# Temperature Probe Data

# Temperature Probe Data

In addition to volume, class and weight data, the Highway Data Section also collects temperature data at many different locations around the state. Temperature readings are taken at several points along a 72" vertical probe that is located just under the road pavement. The probe is made up of 16 thermistors encased in an epoxy. Temperatures are recorded at the pavement surface, just under the pavement, every 3 inches for the first foot, and every 6 inches for the next five feet. Recordings are taken hourly. The data is useful for road design, setting weight restrictions on roads, and also research. Weight restrictions become necessary in the spring and fall when the ground is thawing and freezing. A layer of water collects between the pavement and the frozen ground beneath it, causing the roadbed to become less stable.

The following graphs display the average daily temperature data for the year 2001. Each graph shows the ambient air temperature and the surface pavement temperature. Where the surface temperature is not available, the temperature taken just under the pavement is used. Hourly data for each of the thermistors is available upon request.
